- Simple Integration: 1. Open the application and load files into the interface 2. Add the reference to the EDIVisualizer plugin to your project and make your project compatible with EDIVisualizer. 3. EDIVisualizer will load files for you. If your files contain structure and location information, EDIVisualizer will find them, calculate them, and display them correctly 4. EDIVisualizer makes use of the "File -> Open" function. You can open an.edi file by clicking the file icon. 5. To open a file that has a structure which does not contain structure and location information, copy the URL to the file, copy the file's location and the structure. Then open the file in the interface. - Object-Oriented Architecture: An implementation of the "IPlugin" interface. This plugin interface allows developers to implement functionality inside the application by using the SDK. - Device dependent plugins (i.e. windows mobile, iphone, blackberry): A "Plugin" is a device dependent application running on the mobile device. This "Plugin" provides the design of EDIVisualizer apps specifically for the device on which it is installed. - Restartless Interface: This interface allows a plugin to be restarted by the EDIVisualizer application without restarting the entire application. [1] [2] [3] [4] EDIVisualizer Android SDK structure: - Other classes are defined inside the ui-layer for easy identification. - The SDK provides the base classes to implement the functionality of the EDIVisualizer application. - All functionality to implement plugins is defined inside the core-layer. Plugins are the applications that implement the functionality. - The provider-layer is the layer that implements the functionality of the SDK. To use the SDK, an object of this layer is created. - To use the SDK, an object of the provider-layer must be created. - To create an object of the provider- b7e8fdf5c8

EDIVisualizer SDK

It is a free SDK available to all developers to access full source code, details and demo applications. It contains all the features provided by the application and which makes it compatible with all versions of Windows XP, Windows 7 and Windows Vista. It is composed of a few files, all the information is included in the file which is provided for each of the features. It contains the demo application provided for each of the features and it can be used with the full source code provided in the SDK. Features: EDIVisualizer EDIVisualizer – An software for reading, modifying, and displaying EDI information. It can be used as a stand-alone application, or can be integrated with other applications. The program can be used to read EDI files that are stored locally on the computer system, or they can be accessed over a network, where the file is available on a server. The data usually consists of a text file that is formatted in some kind of computer code, called the Electronic Data Interchange (EDI). This EDI format was designed to allow vendors to inter-relate their data. It was originally used for the interchange of data between manufacturers, until the 1980s. It includes two components: The processor – The processor reads EDI files and generates information for display in the visualizer. The EDIVisualizer component – The visualizer is a tool that allows you to view and manipulate the generated information. The EDIVisualizer contains the following features: Windows XP Windows 7 Windows Vista Display Syntax Formats Relations Subformats Heterogeneous PSE files References Category:Business software Category:EDI softwareQ: Integrating a quick and dirty application created with C++ and wxWidgets I'm a software developer and started learning wxWidgets this weekend. I found the tutorial and I wanted to create a simple application that displays a couple of value using a matrix. My application is made up of three files (see below) and compiles well. But I have no idea how to deploy my application? I don't want to distribute an exe with all my files. Can I distribute just the.cpp and.wxWidgets files? Thank you /home/simone/Desktop/matrice
